Abstract
Subcutaneous bones like tibia are susceptible to compartment syndrome, wound infection, non-union, deformities, shortening and other problems. Duration of treatment and the cost of treatment of infected non-union and gap non-union causes a huge burden to the patient as well as to the treating institution. Distraction osteogenesis is a novel technique by which new bones can be created in the bone defects, limb lengthening to compensate shortening, rotational deformities can be corrected, soft tissue loss can be dealt with progressive histogenesis.

Keywords: Management, infected Nonunion, Gap Nonunion fracture, Ilizarov method

Introduction
Infected non-union is one of the greatest problems in orthopaedic surgeries. The incidence of infected non-union and gap non-union of fractures of long bone is increasing in India due to road traffic accidents. Moreover infected non-union and gap non-union of fracture of long bones is not a single problem, it is associated with multiple problems like long standing infection associated with organism resistant to most of commonly used antibiotics, bone loss due to extensive debridement or primary bone loss at the site of injury, soft tissue loss. There are various treatment modalities available for treatment available for treatment of infected non-union and gap non-union of fracture of long bones. Treatment modalities like wound debridement and external fixation with AO external fixator, antibiotic coated nailing, limb reconstruction system, Ilizarov ring fixation etc., but each method has its own merits and demerits.

Aims and Objectives
To evaluate the outcome on the management of infected non-union and gap non-union fractures of long bones by Ilizarov method.

Materials and Methods
This is a prospective study conducted at The Department of Orthopaedics, Govt. Stanley Medical college & Hospital, Chennai -01 during the period August 2015 to July 2016. Patients admitted with infected non-union fracture of long bones and Gap non-union of long bones due to various causes and was treated with Ilizarov ring fixation method and were studied for the functional outcome, complications, fracture union.

Inclusion Criteria
- Age more than 18 years.
- Both Genders.
- Patient presented with infected non-union fracture of long bones
- Fracture of long bones with bone defect due to trauma, wound debridement, segmental bone loss due to resection of bone tumours.
Exclusion Criteria
- Patients aged less than 18 years.
- Patient with psychotic disorders.
- Patient unwilling for long term treatment and uncooperative for post-operative rehabilitation.

Methods
- General information like Name, Age, Sex, Occupation, Address were noted.
- Mode of injury like Motor vehicle accident, Assault, previous surgeries for infected non-union of fractures, industrial injury, etc were collected.
- General examination like Anemia, Jaundice, lymphadenopathy, blood pressure was noted.
- Systemic examination like Cardiovascular system, respiratory system was examined.
- Open fractures of long bones with bone defect and infected non-union of fractures were debrided and skeletal stabilisation done using AO external fixator.
- Large soft tissue loss was treated with split skin grafting and myocutaneous flap by the plastic surgeon.
- Infected non-union of fractures of long bones were classified using Paley's modification of ILIZAROV'S classification of infected non-union of fractures of long bones and Kulkarni classification of infected non-union fracture of long bones.
- All patients have preoperative X rays of the affected limb for the assessment of level of fracture, type of non-union, rotational deformities, shortening and bone defects.
- Culture swab taken from the wounds and treated with intravenous antibiotics according to the sensitivity pattern.
- Preoperative counselling given to the patient regarding the mode of treatment, Duration of treatment and post-operative rehabilitation and complication related to the surgery.
- Ilizarov ring fixator was constructed on the previous day and sent for sterilization.
- Under subarachnoid block involved limb painted and draped pre-constructed Ilizarov ring was introduced into the limb and fixed with K – wires and tensioned adequately using wire tensioner and schantz pin. Hybrid Ilizarov method using wires and half pins was followed in most of cases.
- Corticotomy was done if necessary and fibular osteotomy in case of bone transport and bone transport was done after the latency period of
- Distraction was done at the rate of 1mm /day and rhythm 0.25mm every 6th hourly.
- Patient were mobilised with partial weight bearing immediately and full weight bearing once tolerated. Method of Distraction of bone segment, Pin site care, joint mobilisation exercises were taught and patient discharged.
- Routine Follow up done at monthly intervals with X rays for assessment of fracture healing, quality of regenerate in distraction osteogenesis and to assess any deformity.
- After completing the bone transport, patient is kept on ring fixator till satisfactory union is achieved.
- If there is any deformity, then realignment of fixator was done accordingly.
- Dynamisation of the fixator was done to achieve union at the docking site.
- Fracture healing assessed radiologically by appearance of bony trabecules at the fracture in atleast three of four cortices in AP and lateral views, clinically by absence of pain and absence of abnormal mobility.
- Once the fracture healed ilizarov fixator was removed after releasing the wire tension and plaster of Paris cast was applied for a period of six weeks and cast was removed then patient allowed to bear weight.
- Results were assessed using the criteria laid down by ASAMI (The Association for Study and Application of the Methods of Ilizarov) scoring system.

Evaluation of the Outcome
For evaluating the results of treatment of infected non-union and gap non-union of fractures by Ilizarov method, we used the Association for the Study and Application of the Methods of Ilizarov (ASAMI) scoring system.
It has two components:
1. Bone Results
2. Functional Results

Bone Results

| Excellent | Unoin,No infection, < 7 degree deformity, Limb length inequality < 2.5 cm |
| Good | Union + any two of the following: No infection, Deformity < 7 degree, Limb length discrepancy < 2.5 cm |
| Fair | Union + only one of the following: no infection, deformity < 7 degree, limb length discrepancy, 2.5 cm |
| Poor | Non union/ refraction/ union+ infection+ deformity > 7 degree + limb length discrepancy > 2.5cm |

Functional Results
Based on the five criteria
1. Obeseavable limp
2. Stiffness (loss of > 15 degree of knee extension and or > 15 degree of ankle dorsiflexion)
3. Reflex sympathetic dystrophy
4. Pain that reduced activity or disturbed sleep
5. Inactivity (due to unemployment or Inability to carry out daily activities)

The functional results were classified as follows
Excellent- If the patient is active, able to do his / her daily activities, and absence of other four criteria.
Good – If the patient is active but one or two of the other criteria are present.
Fair – If the patient is active, with the presence of three or four of the other criteria.
Poor – If the patient is inactive, regardless of the presence of other criteria.

Observation and Results

I. Age Distribution

<table>
<thead>
<tr>
<th>Age in years</th>
<th>No. Of cases</th>

</tr>
</tbody>
</table>
The age group varies from 18 years to 60 years with maximum incidence between 21 to 30 years mostly the young individuals.

II. Sex Distribution
Among 20 patients included in this study, males were predominant accounting to 18 numbers.

III. Side of Injury
In our study, left side of the limb is common.

IV. Mode of Injury
The most common mode of injury is road traffic accident. Only one case is due to chronic osteomyelitis, sequestrectomy done and the defect was treated with Ilizarov bone transport.

</table>
The modal distribution of previous surgeries in our study group is 2.

VIII. Duration of Treatment
The duration of treatment varies from minimum of 5 months to maximum of 13 months with mean duration of 8.8 months.

IX. Complications
Among the complications, shortening is the most common complication which constitutes 80% of cases, and the average shortening was about 2 cm which was within the acceptable limit. The second common complication in the study was joint stiffness which constitutes 60% mostly equines deformity.

X. Outcome
75 percent of the patients had an excellent outcome while no patient suffered from poor outcome

Conclusion
From our observation it is proved that Ilizarov ring fixation is a versatile technique in treatment of infected non-union and gap non-union of fracture of long bones. Majority of the patient had an excellent outcome with regards to deformities, shortening, limb length discrepancies, rotational deformities soft tissue defects etc. Ilizarov ring fixation addressed all these problems simultaneously and successfully
